

(PRIMARY LAW :

Relationship of the Time & Energy()orbit

Definition

1. All things and events are ENERGY
2. Time is therefore a one of the forms of energy
3. The infinite form of Energy in a state, where the Time stands still()
4. Matter and all things including events have their own Orbital characteristics
5. There is no beeline movement in all normal Orbits
6. Geometric dimensions of Orbit determine the shape of time
7. The orbital time is not negative

Laws Creator: Bhudrose Trakulthong

Drafting: May 26, 2025

"Easy is right, if done right it's easy"

For example: The orbit of the Sun is mainly composed of hydrogen. The inner orbit of the Sun has a very short cycle, so the structure of the Sun has a lot of energy.

Innovation()

- The reason physics is not true in all cases is that because there is too much emphasis on speed, it is impossible to surpass the speed of light. Quantum physics, which will answer all the questions, is interpreted based on imaginary ideas, which are even further away from real knowledge.
- *"The true laws of nature()god consist of orbits with inverse time and energy."*

Description()

Matter and objects are composed of an orbit system. An Orbit is the Cycle of processes that give rise to the makeup of matter and things. Orbit is a constant coefficient. The specific components of each Orbit have processes that determine its "characteristics".

Each element has its own specific Orbital value. The specific orbits of many elements Orbit made up the great Orbit of all things.

All orbital elements have time and energy that are inversely constant. Orbits with more elements complete their cycles more slowly than orbits with fewer elements.

All matter is constantly changing and decaying. Metals decay slowly, because the processing time of the orbit is slower than liquids and gases. There is an inverse relationship between time and energy, which arises from the number of elements in the orbit. And we will be able to create a mathematical formula that is true in all cases of matter, time and energy in all branches of physics, which I have summarized as follows:

1. The orbit of all things is made up of orbits of many different substances and elements that come together.

$$\{Ob_t = Ob_1 + Ob_2 + \dots Ob_n\}$$

Ob: Orbit Coefficient

Ob_t: total Orbital Coefficient

Ob_n: Orbital Coefficient Sequence

2. The orbit is the value of the motion that occurs in one revolution(π , λOb). It is the inverse of the energy and time in the orbit, and time must not be negative.

$$Ob.\pi = E / \sqrt{Tob}$$

and then, $Tob = 0$; $E = \infty$

Tob: Time in Orbital Coefficient

$Tob = \lambda Ob$ (λOb : Orbital geometric shape)

3. Energy is therefore the type of orbit multiplied by the time of the orbital coefficient(tob).

$$E = Ob.\pi \sqrt{Tob}$$

"Time is therefore a one of the forms of energy"

In every true occurrence, the truth arises from the bond between time(tob) and energy(e), and by understanding the coefficients of each orbit, which are constants specific to each element, each substance, etc., we can understand the system of time and matter that is true in every case, every place in the universe, at the common sense level...

Suppose: That we were born on the Sun, have a modified orbiting body, when we come to the human world. We will see people and everything on Earth, both in terms of thoughts and movements, very slowly. We will immediately become the superman of the world...
